

Abstract of the Disclosure

The invention is a kind of medical diagnosis method. The invention use wrist radius artery digital indicator, after collecting 18 kinds of artery blood vessel pulse standard value, graphs on radius artery, edit them into standard pattern data base software, provides the user that after the user input the information from the digital indicator, the determined input information for consulting results will be the output, when the user browses on internet by distant landing, make the software and website data base connected together, to handle the processing continuously, decide the diagnostic of resegmenting type of specific disease and disease group of 18 kinds of radius artery blood vessel pulse standard value, the difference between the determined value and the standard value could reason out the specific diagnosing result.
